Installation procedure for Sound Blaster AudioPCI 64V drivers with Windows* NT operating systems.

1) Down load ALL self-extracting driver files, related to this driver set, into a directory on the target system hard drive. Multiple files are provided because a single zip file would be too large for down loading over a modem. These compressed files include all the driver files required to meet PC9x certification.
2) Execute the batch file (file.BAT) provided with the driver set to re-assemble the downloaded files into a single self extracting zip file.
3) All driver files included with this driver set must be present in the target directory prior to installation. Execute the self- extracting file assembled by the batch file.

Required!!!
  Before proceeding to the next step read carefully!
  The directory structure must be maintained for successful driver installation. This requires executing the extracted SW.EXE self-extracting file by typing, from a DOS prompt, " SW –d".
4) Once all the driver files are present in the target system directory, run the sbsetup.exe in the AUDIO\ENGLISH\DRIVERS directory assembled after step 3. The InstallWizard will remove old driver versions and install the new drivers. Follow the InstallWizard directions to complete installation.
5) The InstallWizard may request the Windows NT CDROM be inserted. Provide this CD when requested.
6) You will need to restart the computer before the drivers will become effective.
