## **Before You Start**

This Online Manual will introduce to the user how this product is installed. All useful information will be described in later chapters. Please keep this manual carefully for future upgrades or system configuration changes. This Online Manual is saved in [PDF format](#), we recommend using Adobe Acrobat Reader 4.0 for online viewing, it is included in [Bonus CD disc](#) or you can get free download from [Adobe web site](#).

Although this Online Manual is optimized for screen viewing, it is still capable for hardcopy printing, you can print it by A4 paper size and set 2 pages per A4 sheet on your printer. To do so, choose **File > Page Setup** and follow the instruction of your printer driver.

Thanks for the help of saving our earth.

## Overview

Thank you for choosing AOpen AK73 Pro/AK73 Pro(A). The AK73 Pro/AK73 Pro(A) is AMD® Socket 462 motherboard (M/B) based on the ATX form factor featuring the [VIA Apollo KT133/KT133A chipset](#). As high performance chipset built in the M/B, the AK73 Pro/AK73 Pro(A) can support AMD® Socket 462 series Athlon™ & Duron™ processor and 200/266MHz ([EV6](#)) system bus. In the AGP performance, it has one AGP Pro slot (optional) and supports AGP 1X/2X/4X mode and pipelined spilt-transaction long burst transfer up to 1066MB/sec. According to different customer's requirements, [SDRAM](#), [VCM \(Virtual Channel Memory\)](#) and [PC-100](#) Registered DRAM can be applied to the AK73 Pro/AK73 Pro(A) and the maximum memory size can be up to 1.5GB. The on-board IDE controller supports [Ultra DMA](#) 33/66/100 mode and the transfer rate up to 100MB/s. Besides, the on-board [AC97 CODEC](#) chip with SoundMax 2.0 provides high performance and magic surround stereo sound to let people enjoy working with AK73 Pro/AK73 Pro(A). Now, enjoy all features from AOpen AK73 Pro/AK73 Pro(A).

## Feature Highlight

### CPU

Supports AMD® Socket 462 Athlon® & Duron® 600MHz~1GHz+ with 200/266MHz EV6 system bus designed for Socket 462 technology.

### Chipset

The VIA Apollo KT133/KT133A chipset incorporated as a north bridge is in charge of the host bus interface and memory bus control. The memory bus control supports two and four way interleaved of PC-100 and PC-133 SDRAM registered\* DIMM and VCM up to 1.5GB. The north bridge provides one 32bit PCI bus running at 33MHz and another secondary PCI bus running at 33/66MHz. (\*The VIA Apollo KT133 chipset only support PC-100 registered DIMM module.)

### Memory

The three 168-pin DIMM system memory sockets that support up to 1.5GB of PC-100/133 compliant [SDRAM](#) (Synchronous Dynamic Random Access Memory), [VCM](#) (Virtual Channel Memory) and PC-100 Registered DIMMs. You can install 32, 64, 128, 256 and 512MB SDRAM DIMM module into each socket.

## Expansion Slots

Including five 32-bit/33MHz, one AMR and one AGP (AGP Pro slot is optional) slots. The PCI local bus throughput can be up to 132MB/s. The [AMR \(Audio/Modem Riser\)](#) slot provided from AK73 Pro/AK73 Pro(A) can support AMR interface for a Modem card. The Intel® AGP Pro rev. 1.0 specification provides a new level of video display sophistication and speed. The AGP Pro video cards support data transfer rates up to 1066MB/s. As AK73 Pro/AK73 Pro(A) include one AGP Pro expansion slot for a bus mastering AGP graphics card. For AD and SBA signaling, AK73 Pro/AK73 Pro(A) can supports 133MHz 2X/4X mode.

## Ultra DMA 33/66/100 Bus Master IDE

Comes with an on-board PCI Bus Master IDE controller with two connectors that supports four IDE devices in two channels, supports Ultra DMA 33/66/100, PIO Modes 3 and 4 and Bus Master IDE DMA Mode 4, and supports Enhanced IDE devices.

## CPU Vcore & Ratio Adjustment

Providing CPU Vcore and ratio adjustment function that makes your CPU get maximum performance and system reliability when you overclocking. You can select the CPU ration from 5 to 12.5 by DIP switch, and adjust the CPU Vcore value in the BIOS setup program.

### **CPU Overheat Protection**

Provides two ways to prevent CPU caused damage by overheat. You can enable/disable these two special functions by BIOS setup program. Please refer to [page 28](#) for more information.

### **On-board AC97 Sound**

AK73 Pro/AK73 Pro(A) uses the AD1885 AC97 sound chip. This on-board audio includes a complete audio recording and playback system.

### **Die-Hard BIOS with external controller (Optional)**

The Die-Hard BIOS technology is a very effective hardware protection method that doesn't involve any software or BIOS coding. Hence, it is 100% virus free.

### **Dr. LED (Optional)**

The Dr. LED has 8 LEDs on the AK73 Pro/AK73 Pro(A) and can easily show what kind of problem you may encounter.

### **Dr. Voice (Optional)**

The Dr. Voice provides 4 kinds of language version (English, Chinese, Japanese and German) that can easily tell what kind of problem you may encounter.

### **Power Management/Plug and Play**

The AK73 Pro/AK73 Pro(A) supports the power management function that conforms to the power-saving standards of the U.S. Environmental Protection Agency (EPA) Energy Star program. It also offers Plug-and-Play, which helps save users from configuration problems, thus making to system user-friendlier.

### **Hardware Monitoring Management**

Supports CPU or system fans status, temperature and voltage monitoring and alert, through the on-board hardware monitor module and [Aopen Hardware Monitoring Utility](#).

### **Enhanced ACPI**

Fully implement the [ACPI](#) standard for Windows® 95/98/ME/NT/2000 series compatibility, and supports Soft-Off, STR (Suspend to RAM, S3), STD (Suspend to Disk, S4), WOM (Wake On Modem), WOL (Wake On LAN) features.

**Super Multi-I/O**

The AK73 Pro/AK73 Pro(A) provides two high-speed UART compatible serial ports and one parallel port with EPP and ECP capabilities. UART2 can also be directed from COM2 to the Infrared Module for the wireless connections.

## **Quick Installation Procedure**

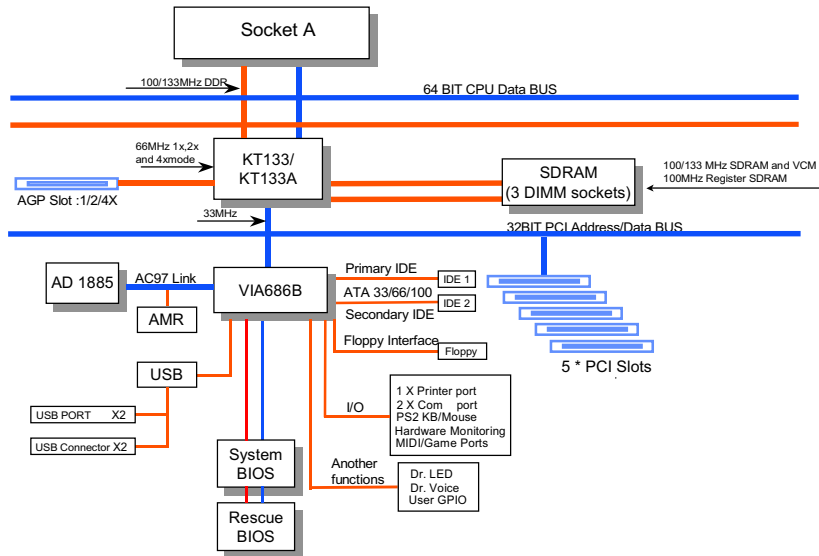

This page gives you a quick procedure on how to install your system. Follow each step accordingly.

- 1** [Installing CPU and Fan](#)
- 2** [Installing System Memory \(DIMM\)](#)
- 3** [Connecting Front Panel Cable](#)
- 4** [Connecting IDE and Floppy Cable](#)
- 5** [Connecting ATX Power Cable](#)
- 6** [Connecting Back Panel Cable](#)
- 7** [Power-on and Load BIOS Setup Default](#)
- 8** [Setting CPU Frequency](#)
- 9** Reboot
- 10** [Installing Operating System \(such as Windows 98\)](#)
- 11** [Installing Driver and Utility](#)

Motherboard Map

## Block Diagram

# Hardware Installation

This chapter describes jumpers, connectors and hardware devices of this motherboard.

**Note:** Electrostatic discharge (ESD) can damage your processor, disk drives, expansion boards, and other components. Always observe the following precautions before you install a system component.

1. Do not remove a component from its protective packaging until you are ready to install it.
2. Wear a wrist ground strap and attach it to a metal part of the system unit before handling a component. If a wrist strap is not available, maintain contact with the system unit throughout any procedure requiring ESD protection.

## JP14 Clear CMOS

You can clear CMOS to restore system default setting. To clear the CMOS, follow the procedure below.

1. Turn off the system and unplug the AC power.
2. Remove ATX power cable from connector PWR2.
3. Locate JP14 and short pins 2-3 for a few seconds.
4. Return JP14 to its normal setting by shorting pins 1 & pin2.
5. Connect ATX power cable back to connector PWR2.

Normal Operation  
(default)

Clear CMOS

### **Tip:** When should I Clear CMOS?

1. Boot fail because of overclocking...
2. Forget password...
3. Troubleshooting...

## CPU Installation

This motherboard supports AMD Athlon & Duron Socket 462 CPU. Be careful of CPU orientation when you plug it into CPU socket.

CPU socket  
Lever

CPU Pin1  
and cut edge

1. Pull up the CPU socket level and up to 90-degree angle.
2. Locate Pin 1 in the socket and look for a black dot or cut edge on the CPU upper interface. Match Pin 1 and cut edge. Then insert the CPU into the socket.
3. Press down the CPU socket level and finish CPU installation.

**Note:** If you do not match the CPU socket Pin 1 and CPU cut edge well, it may damage the CPU.

## FSB/PCI Clock & Ratio

This jumper is used to specify the relationship of PCI and [FSB](#) clock. Generally speaking, if you are not an overclocker, we recommend you to set at the default setting.

CPU Ratio	SW1-1	SW1-2	SW1-3	SW1-4
5	-	-	+	-
5.5	+	-	+	-
6	-	+	+	-
6.5	+	+	+	-
7	-	-	-	+
7.5	+	-	-	+
8	-	+	-	+
8.5	+	+	-	+
9	-	-	+	+
9.5	+	-	+	+
10	-	+	+	+
10.5	+	+	+	+
11	-	-	-	-
11.5	+	-	-	-
12	-	+	-	-
12.5	+	+	-	-
CPU Default	0	0	0	0

**Note:** The CPU ratio adjustable function based on the CPU type. Please refer to the technical document for more detail information of overclocking.

## Supported CPU Frequency

Core Frequency = CPU Bus Clock \* CPU Ratio

EV6 Bus Speed = CPU Bus Clock x 2

PCI Clock = CPU Bus Clock / Clock Ratio

AGP Clock = PCI Clock x 2

**Tip:** If your system hangs or fails to boot because of overclocking, simply use <Home> key to restore the default setting (100MHz FSB/200MHz or 133MHzFSB/266MHzDDR Bus)

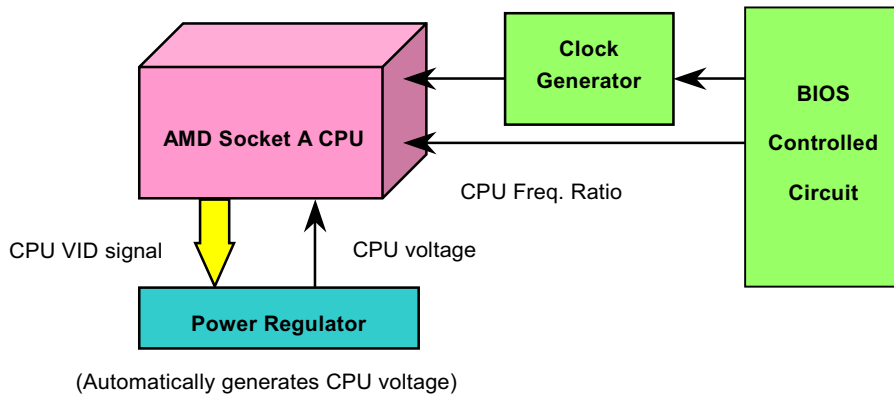

CPU	CPU Core Frequency	EV6 Bus Clock	Ratio
Athlon 600	600MHz	200MHz	6x
Athlon 650	650MHz	200MHz	6.5x
Athlon 700	700MHz	200MHz	7x
Athlon 750	750MHz	200MHz	7.5x
Athlon 800	800MHz	200MHz	8x
Athlon 850	850MHz	200MHz	8.5x
Athlon 900	900MHz	200MHz	9x
Athlon 950	950MHz	200MHz	9.5x
Athlon 1000	1GHz	200MHz	10x
Duron 600	600MHz	200MHz	6x
Duron 650	650MHz	200MHz	6.5x
Duron 700	700MHz	200MHz	7x
Duron 750	750MHz	200MHz	7.5x

**Warning:** VIA Apollo KT133/KT133A chipset supports maximum 100MHz/200MHz DDR Bus or 133MHz/266MHzDDR Bus, and 66MHz AGP clock, higher clock setting may cause serious system damage.

## CPU Jumper-less Design

CPU VID signal and [SMBus](#) clock generator provide CPU voltage auto-detection and allows the user to set the CPU frequency through the [BIOS setup](#), therefore no jumpers or switches are used. The disadvantages of the Pentium based jumper-less designs are eliminated. There will be no worry of wrong CPU voltage detection.

## Full-range Adjustable CPU Core Voltage

This function is dedicated to overclocker, AOpen works together with Fairchild to develop a special chip FM3540 that supports Adjustable CPU Core Voltage from 1.1V to 1.85V by 0.025 stepping. But this motherboard can also automatically detect CPU VID signal and generates proper CPU core voltage.

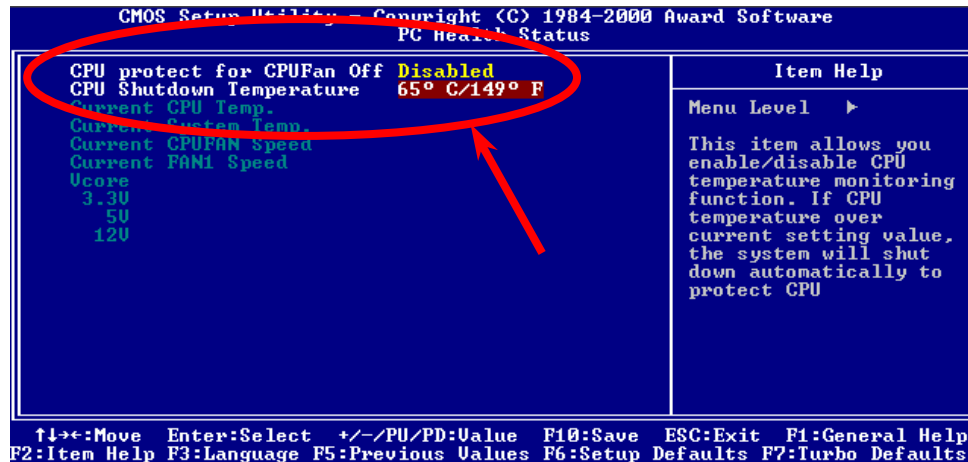

**BIOS Setup > Frequency/Voltage Control > [CPU Voltage Setting](#)**

**Warning:** High CPU core voltage may be able to increase CPU speed for overclocking, but you may damage the CPU or reduce the CPU lifecycle.

## CPU Overheat Protection

Based on high CPU operating frequency, the AMD® Athlon™/Duron™ Socket 462 series CPU requires heatsink with cooling fan when it is powered up. AOpen provides two new features in an easy and user friendly BIOS setting to protect your CPU investment, preventing CPU operating under overheat condition or CPU gets damaged by the high temperature if cooling fan fails or is under the designated speed (RPM).

If the "CPU Cooling Fan Malfunction Protection" function is enabled, BIOS will monitor CPU cooling fan speed immediately. If the cooling fan speed is lower than (500???)RPM or failed, the system will shutdown automatically to protect CPU. You also can set the "CPU shutdown temperature" from 55°C to 70°C by 5°C stepping. When this function is enabled and BIOS detects CPU temperature is over setting value, the system will shutdown automatically, too.

There are situations where the system is shutdown automatically by these two CPU protection functions and you need to bring back the system to operating mode, just simply press the <F10> key continuously while the system is doing POST (Power-On Self Test) to disable these two functions.

**Note:** You must using 3-pin CPU cooler fan with this motherboard. Only 3-pin cooler fan has support hardware monitoring function.

**Warning:** Powering up the system without CPU heatsink and cooling fan will permanently damage the CPU in just a few seconds.

## CPU and Housing Fan Connector (With H/W Monitoring)

Plug in the CPU fan cable to the 3-pin **CPUFAN** connector. If you have housing fan, you can also plug it on **FAN2** connector.

CPUFAN

GND  
+12V  
SENSOR

FAN2

**Note:** Some CPU fans do not have sensor pin, so that cannot support fan monitoring. The Fan1 doesn't support the H/W monitoring function.

## DIMM Socket

This motherboard has three 168-pin [DIMM](#) sockets that allow you to install [PC100](#) or [PC133](#) memory up to 1.5GB. The AK73 Pro/AK73 Pro(A) supports not only [SDRAM](#) but also [VCM](#) and PC-100 Registered DRAM.

**Tip:** The driving capability of new generation chipset is limited due to the lack of a memory buffer (to improve performance). This makes DRAM chip count an important factor to take into consideration when you install DIMMs. Unfortunately, there is no way that the BIOS can identify the correct chip count; you need to calculate the chip count by yourself. The simple rule is: **By visual inspection, use only DIMMs that are less than 16 chips.**

DIMM can be single side or double side; it has 64 bit data and 2 or 4 clock signals. We strongly recommend choosing 4-clock SDRAM for its reliability

**Tip:** To identify 2-clock and 4-clock DIMM, you may check if there are traces connected to the golden finger pins 79 and 163 of the SDRAM. If there are traces, the SDRAM is probably 4-clock; otherwise, it is 2-clock.

**Tip:** To identify single-side or double-side DIMM, check golden finger pin 114 and pin 129. If there are traces connected to pin 114 and pin 129, the DIMM is probably double side; otherwise, it is single-side.

## 3.3V Main Power Adjustable

The JP9 and JP10 provide the great feature that can let you choose the 3.3V VIO value. This feature let the system get more reliable when you overclocking.

**Warning:** Higher voltage may be able to increase system reliability for overclocking, but you may damage/reduce the DIMM module, chipset or others 3.3V device lifecycle.

### **3.3V RAM Power LED**

This LED indicates there is power applies to memory. It is useful to check RAM power during Suspend to RAM. Do not unplug memory module when this LED is on.

## Front Panel Connector

Attach the power LED, Keylock, speaker, and reset switch connectors to the corresponding pins. If you enable "[Suspend Mode](#)" item in BIOS Setup, the ACPI & Power LED will keep flashing while the system is in suspend mode.

Locate the power switch cable from your ATX housing. It is 2-pin female connector from the housing front panel. Plug this connector to the soft-power switch connector marked **SPWR**.

<b>Suspend Type</b>	<b>ACPI LED</b>
Power on Suspend (S1)	Flashing for every second
Suspend to RAM (S3 ) or Suspend to Disk (S4)	The LED will be turned off

## ATX Power Connector

The ATX power supply uses 20-pin connector shown below. Make sure you plug in the right direction.

## **AC Power Auto Recovery**

A traditional ATX system should remain at power off stage when AC power resumes from power failure. This design is inconvenient for a network server or workstation, without an UPS, that needs to keep power-on. This motherboard implements an AC Power Auto Recovery function to solve this problem. If BIOS Setup > Integrated Peripherals > [AC PWR Auto Recovery](#) is set to "On" the system will automatically power-on after AC power resumes.

## IDE and Floppy Connector

Connect 34-pin floppy cable and 40-pin IDE cable to floppy connector FDC and IDE connector. The **blue connector** is IDE1 for clear identification. Be careful of the pin1 orientation. Wrong orientation may cause system damage.

IDE1 is also known as the primary channel and IDE2 as the secondary channel. Each channel supports two IDE devices that make a total of four devices. In order to work together, the two devices on each channel must be set differently to **Master** and **Slave** mode. Either one can be the hard disk or the CDROM. The setting as master or slave mode depends on the jumper on your IDE device, so please refer to your hard disk and CDROM manual accordingly.

**Warning:** The specification of the IDE cable is a maximum of 46cm (18 inches), make sure your cable does not exceed this length.

**Tip:** For better signal quality, it is recommended to set the far end side device to master mode and follow the suggested sequence to install your new device. Please refer to above diagram

This motherboard supports [ATA33](#), [ATA66](#) or [ATA100](#) IDE devices. Following table lists the transfer rate of IDE PIO and DMA modes. The IDE bus is 16-bit, which means every transfer is two bytes.

Mode	Clock Period	Clock Count	Cycle Time	Data Transfer Rate
PIO mode 0	30ns	20	600ns	(1/600ns) x 2byte = 3.3MB/s
PIO mode 1	30ns	13	383ns	(1/383ns) x 2byte = 5.2MB/s
PIO mode 2	30ns	8	240ns	(1/240ns) x 2byte = 8.3MB/s
PIO mode 3	30ns	6	180ns	(1/180ns) x 2byte = 11.1MB/s
PIO mode 4	30ns	4	120ns	(1/120ns) x 2byte = 16.6MB/s
DMA mode 0	30ns	16	480ns	(1/480ns) x 2byte = 4.16MB/s
DMA mode 1	30ns	5	150ns	(1/150ns) x 2byte = 13.3MB/s
DMA mode 2	30ns	4	120ns	(1/120ns) x 2byte = 16.6MB/s
UDMA 33	30ns	4	120ns	(1/120ns) x 2byte x2 = 33MB/s
UDMA 66	30ns	2	60ns	(1/60ns) x 2byte x2 = 66MB/s
UDMA100	20ns	2	40ns	(1/40ns) x 2byte x2 = 100MB/s

**Tip:** To achieve the best performance of Ultra DMA 66/100 hard disks, a special **80-wires IDE cable** for Ultra DMA 66/100 is required.

## IrDA Connector

The IrDA connector can be configured to support wireless infrared module, with this module and application software such as Laplink or Windows 95 Direct Cable Connection, the user can transfer files to or from laptops, notebooks, PDA devices and printers. This connector supports HPSIR (115.2Kbps, 2 meters) and ASK-IR (56Kbps).

Install the infrared module onto the **IrDA** connector and enable the infrared function from BIOS Setup, [UART2 Mode](#), make sure to have the correct orientation when you plug in the IrDA connector.

## WOM (Zero Voltage Wake on Modem)

This motherboard implements special circuit to support Wake On Modem, both Internal modem card and external box modem are supported. Since Internal modem card consumes no power when system power is off, it is recommended to use an internal modem. To use internal modem, connect 4-pin cable from **RING** connector of modem card to the **WOM** connector on the motherboard.

### **WOM by External BOX Modem**

Traditional Green PC suspend mode does not really turn off the system power supply, it uses external box modem to trigger MB COM port and resume back to active.

## WOM by Internal Modem Card

With the help of the ATX soft power On/Off, it is possible to have a system totally power off, and wakeup to automatically answer a phone call as an answering machine or to send/receive a fax. You may identify whether or not your system is in true power off mode by checking to see if the fan of your power supply is off. Both an external box modem and an internal modem card can be used to support Modem Wake Up, but if you use an external modem, you have to leave your box modem on.

**Note:** With AOpen Motherboard plus AOpen Modem Card, the power can be totally off.

## WOL (Wake on LAN)

This feature is very similar as [Wake On Modem](#), but it goes through local area network. To use Wake On LAN function, you must have a network card with chipset that supports this feature, and connect a cable from LAN card to motherboard WOL connector. The system identification information (probably IP address) is stored on network card and because there is a lot of traffic on the Ethernet, you need to install network management software, such as ADM, for the checking of how to wake up the system. Note that, at least 600mA ATX standby current is required to support the LAN card for this function.

## AGP (Accelerated Graphic Port)

The AK73 Pro/AK73 Pro(A) provides an [AGP](#) 4x (AGP Pro is optional) slot. The AGP 4x/Pro is a bus interface targeted for high-performance 3D graphic. Recently, there are more memory modules on the AGP card. Hence, the AGP card needs more power to drive these chips. The AGP Pro interface has more power pins to provide more power for the card. AGP supports only memory read/write operation and single-master single-slave one-to-one only. AGP uses both rising and falling edge of the 66MHz clock, for 2X AGP, the data transfer rate is  $66\text{MHz} \times 4\text{bytes} \times 2 = 528\text{MB/s}$ . AGP is now moving to AGP 4x/Pro mode,  $66\text{MHz} \times 4\text{bytes} \times 4 = 1056\text{MB/s}$ .

## **AMR (Audio/Modem Riser)**

[AMR](#) is a riser card that supports sound or modem function. Because CPU computing power is getting stronger, the digital processing job can be implemented in main chipset and share CPU power. The analogical conversion ([CODEC](#)) circuit requires a different and separate circuit design, it is put on AMR card. This motherboard implements sound CODEC on board (can be disabled by JP12), but reserve AMR slot for the option of modem function. Note that you can still use PCI modem card.

## PC99 Color Coded Back Panel

The onboard I/O devices are PS/2 Keyboard, PS/2 Mouse, serial ports COM1 and COM2, Printer, [four USB](#), AC97 sound and Game port. The view angle of drawing shown here is from the back panel of the housing.

- Speaker Out:** To External Speaker, Earphone or Amplifier.  
**Line-In:** From the signal source, such as CD/Tape player.  
**MIC-In:** From Microphone.  
**Game Prot:** To 15-pin PC joystick or game pad.

## Support 2<sup>nd</sup> USB Port

This motherboard supports four USB ports. Two of them are on back panel connector, the other two are on the left-bottom area of this motherboard. With proper cable, you can connect them to front panel.

### JP12 Enable/Disable Onboard Sound

This motherboard has [AC97](#) sound onboard. JP12 is used to enable or disable onboard AD1885 [CODEC](#) chip. If you don't want to enable the Onboard Audio, you should set this jumper to 2-3, and disable the "OnChip Sound" from BIOS setting > Advanced Chipset Features, before you install your preferred PCI Sound Card.

## CD Audio Connector

This **black** connector is used to connect CD Audio cable from CDROM or DVD drive to onboard sound.

CD-IN

## Modem Audio Connector

This connector is used to connect Mono In/Mic Out cable from internal modem card to onboard sound circuit. The pin 1-2 is **Mono In**, and the pin 3-4 is **Mic Out**. Please note that there is no standard for this kind of connector yet, only some internal modem cards implement this connector.

## Video-Audio-IN Connector

This **green** connector is used to connect MPEG Audio cable from MPEG card to onboard sound.

VIDEO\_AUDIO\_IN

### **Front Panel Audio (Optional)**

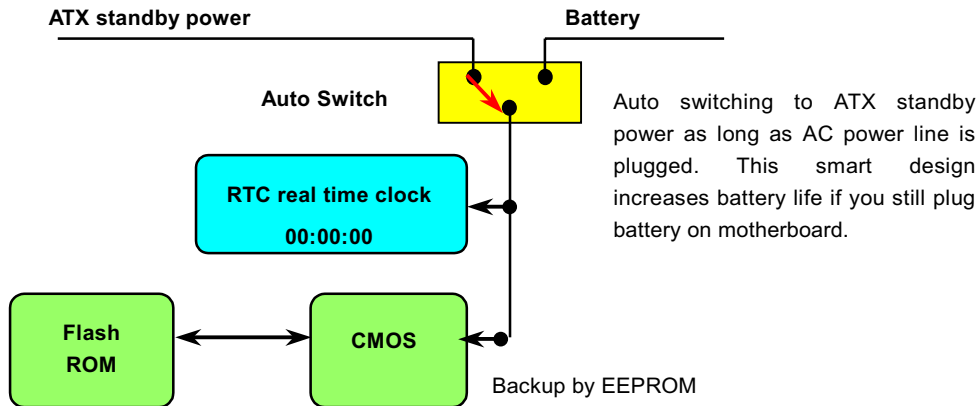

If the housing has been design with an audio port on the front panel, you'll be able to connect onboard audio to front panel through this connector.

- 1 GND
- 2 NC
- 3 Phone\_R
- 4 Phone\_L
- 5 NC
- 6 FP\_Mic

## Battery-less and Long Life Design

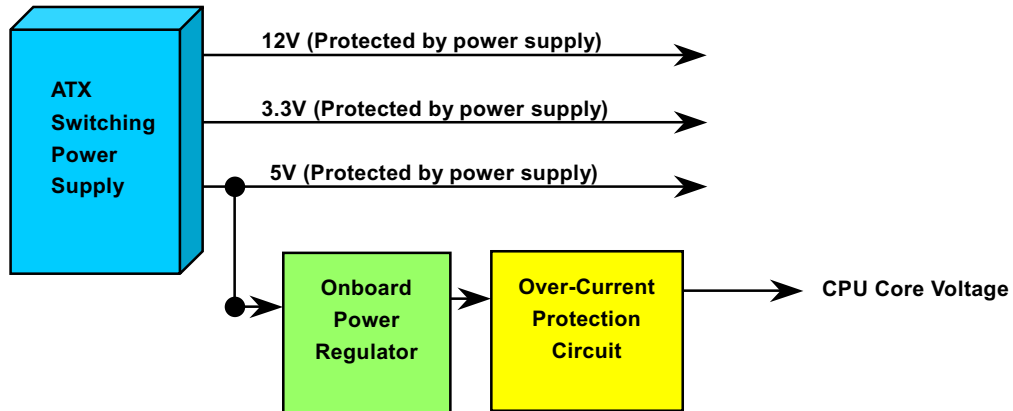

This Motherboard implements [Flash ROM](#) and a special circuit that allows you to save your current CPU and CMOS Setup configurations without the need of a battery. The RTC (real time clock) can also keep running as long as the power cord is plugged. If you lose your CMOS data by accident, you can just reload the CMOS configurations from [Flash ROM](#) and the system will recover as usual.

## Over-current Protection

The Over Current Protection was very popular implemented on ATX 3.3V/5V/12V switching power supply. However, the new generation CPU uses different voltage that has regulator to transfer 5V to CPU voltage (for example, 2.0V), and makes 5V over current protection useless. This motherboard is with switching regulator onboard supports CPU over-current protection; in conjunction with 3.3V/5V/12V power supply provide the full line over-current protection.

**Note:** Although we have implemented protection circuit try to prevent any human operating mistake, there is still certain risk that CPU, memory, HDD, add-on cards installed on this motherboard may be damaged because of component failure, human operating error or unknown nature reason. **AOpen cannot guaranty the protection circuit will always work perfectly.**

## Hardware Monitoring

This motherboard implements a hardware monitoring system. As you turn on your system, this smart design will continue to monitor your system's working voltage, fan status and CPU temperature. If any of these system's status go wrong, there will be an alarm through the AOpen [Hardware Monitoring Utility](#) to warn the user.

## Resettable Fuse

Traditional motherboard has fuse for Keyboard and [USB](#) port to prevent over-current or shortage. These fuses are soldered onboard that when it is broken (did the job to protect motherboard), user still cannot replace it and the motherboard is still malfunction.

With expensive Resettable Fuse, the motherboard can back to normal function after fuse did the protection job.

## JP30 Die-Hard BIOS (100% Virus Protection)

Recently, many viruses have been found that may destroy bios code and data area. This motherboard implements a very effective hardware protection method that does not involve any software or BIOS coding, hence is 100% virus free. There is a BIOS flash ROM mounted on the M/B when you get it. If you want to add extra BIOS flash ROM, please contact the local distributor or reseller. You also can link to AOpen official website: [www.aopen.com.tw](http://www.aopen.com.tw) by Internet to purchase it.

Normal Rescue  
(Default)

Pin 1

Rescue  
BIOS  
Socket

## External Controller for DIE-HARD BIOS (Optional)

**External Controller** provides you a better and convenience way to switch the BIOS status between “**Rescue**” and “**Normal**” without opening the case of your computer. You have to plug the jumper cable to the connector pin (**JP30**) on the motherboard. Be careful of the orientation when you connect, the red wire should correspond to Pin1.

**Note:** If you suspect your BIOS is infected by virus, just rescue your bios by following steps:

1. Turn off the system, set the External Controller to **"Rescue"** to read from rescue ROM.
2. Boot the system and set the switch back to **"Normal"**.
3. Follow the BIOS upgrade procedure to rehabilitate BIOS.

Reboot the system, and you should be able to back to normal.

**Tip:** If you place the switch to the middle, you will not be able to boot your system, thus you can protect your data from

## GPO (General Purpose Output) Connector

**GPO (General Purpose Output)** is an advanced specification developed by AOpen for power users to define the further function by oneself. For example, you can design a daughter board to provide additional capabilities, such as an alarm, a buzzer, a timekeeper, etc.

## Dr. LED Connector (Optional)

In conjunction with Dr. LED (Optional), which can easily show what kind of problem you may incur on your system during assembly. It can clearly indicate whether there is a component issue or an installed issue by the 8 LEDs on the front panel of Dr. LED. This helps you quickly self-diagnostic your system status.

Dr. LED

Dr. LED is a CD disc storage box with 8 LEDs on its front panel, the size of Dr. LED is exactly the same as 5.25 in floppy drive, so that it can be mount into normal 5.25 in drive bay of any housing.

The total 8 LEDs light up alternatively if the system fails in one of eight stages. Once the LED7 (latest LED) is lit, this indicates that the system has completed its boot-up procedure.

The 8 LEDs indicate the following messages when lit:

LED 0 - Indicates that the CPU may have been installed incorrectly or is damaged.

LED 1 - Indicates that the memory may have been installed incorrectly or is damaged.

LED 2 - Indicates that the AGP may have been installed incorrectly or is damaged.

LED 3 - Indicates that the PCI card may have been installed incorrectly or is damaged.

LED 4 - Indicates that the floppy disk drive may have been installed incorrectly or is damaged.

LED 5 - Indicates that the HDD may have been installed incorrectly or is damaged.

LED 6 - Indicates that the keyboard may have been installed incorrectly or is damaged.

LED 7 - Indicates that the system is OK.

**Note:** During POST (power on self test) procedure, the Debug LED will light on sequentially from LED0 to LED7 until the system boot O.K

## Dr. Voice (Optional)

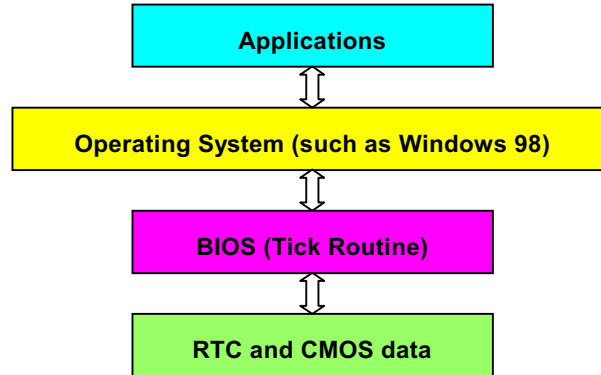

The **Dr. Voice** is a great feature of AK73 Pro/AK73 Pro(A). It can let you easily to know what kind of problem occurred. It can clearly “**tell**” whether there is a component issue or an installed issue, such as CPU, memory module, VGA, PCI add-on card, FDD, HDD or keyboard by voice. The Dr. Voice provides four kinds of language version, **English**, **German**, **Japanese** and **Chinese** for choosing. You can select preferred language version by **JP15** & **JP16**.

## **Year 2000 (Y2K)**

Y2K is basically a problem of the identification of year code. To save storage space, traditional software uses only two digits for year identification. For example, 98 for 1998 and 99 for 1999, but 00 will be confused with 1900 and 2000.

There is an RTC circuit (Real Time Clock) in conjunction with 128 bytes of CMOS RAM data in the chipset of the motherboard. The RTC has only two digits and the CMOS has another 2 digits. Unfortunately, this circuit's behavior is like this 1997 → 1998 → 1999 → 1900, that means it may have the Y2K problem. Below is a diagram of how applications work with the OS, BIOS and RTC. In order to keep the best compatibility in the PC industry there is a rule that applications must call the OS to get services and OS must call the BIOS, and then only BIOS is allowed to access the hardware (RTC) directly.

There is a Tick Routine (that goes live around every 50m sec) in the BIOS to keep record of date/time information. In general the BIOS, this Tick Routine does not update the CMOS every time because the CMOS is a very slow device that degrades system performance. The Tick Routine of the AOpen BIOS has 4 digits for year coding, as long as applications and the operating system follow the rule to get date/time information. There will be no Y2K problem (such as NSTL's test program). But unfortunately again, we found some test programs (such as Checkit 98) accesses RTC/CMOS directly. **This motherboard has hardware Y2K checking and protection that ensures risk free operation.**

### **Low ESR Capacitor**

The quality of low ESR capacitor (Low Equivalent Series Resistance) during high frequency operation is very important for stability of CPU power. The location of where to put these capacitors is another know-how that requires experience and detail calculation.

The power circuit of the CPU core voltage must be checked to ensure system stability for high speed CPUs (such as the new Pentium III, or when overclocking). A typical CPU core voltage is 2.0V, so a good design should control voltage between 1.860V and 2.140V. That is, the transient must be below 280mV. Below is a timing diagram captured by a Digital Storage Scope, it shows the voltage transient is only 143mV even when maximum 18A current is applied.

Note: This diagram for example only, it may not be exactly the same as this motherboard.

## Layout (Frequency Isolation Wall)

Note: This diagram for example only, it may not be exactly the same as this motherboard.

For high frequency operation, especially overclocking, layout is the most important factor to make sure chipset and CPU working in stable condition. The layout of this motherboard implements AOpen's unique design called "Frequency Isolation Wall". Separating each critical portion of motherboard into regions where each region operates in a same or similar frequency range to avoid cross talk and frequency interference between each region's operations and condition. The trace length and route must be calculated carefully. For example, the clock trace must be equal length (not necessarily as short as possible) so that clock skew will be controlled within few a pico second ( $1/10^{12}$  Sec)

## **24K Gold Heatsink**

Cool down CPU and Chipset is important for system reliability. Gold Heatsink provides better heat consumption especially when you are trying to overclock.

## Driver and Utility

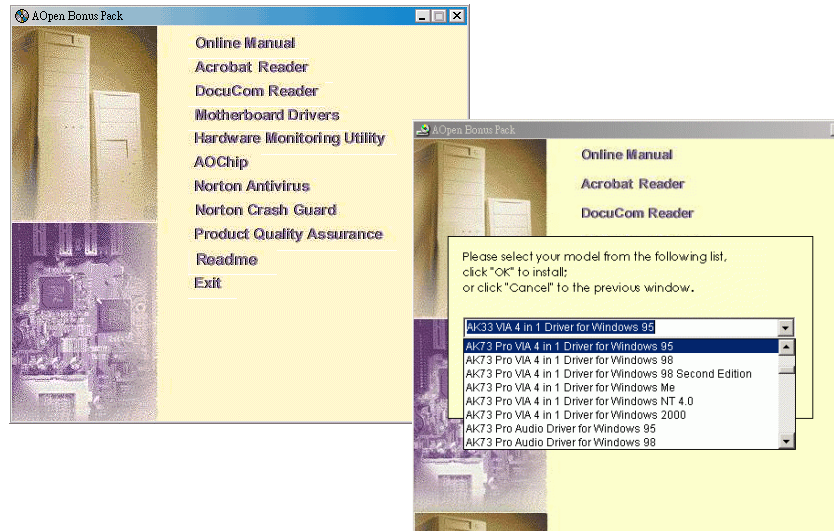

There are motherboard drivers and utilities included in [AOpen Bonus CD disc](#). You don't need to install all of them in order to boot your system. But after you finish the hardware installation, you have to install your operation system first (such as Windows 98) before you can install any drivers or utilities. Please refer to your operation system's installation guide.

**Note:** Please follow recommended procedure to install [Windows 95](#) and [Windows 98](#).

## Autorun Menu from Bonus CD Disc

You can use the autorun menu of Bonus CD disc. Choose the utility and driver and select model name.

## **Installing Windows 95**

1. First, don't install any add-on card except [AGP](#) card.
2. Install Windows 95 OSR2 v2.1, 1212 or 1214 version and later with USB support. Otherwise, you need to install USBSUPP.EXE.
3. Install the [VIA 4 in 1 driver](#), which includes VIA AGP Vxd driver, VIA ATAPI Vendor Support driver and VIA registry (INF) program.
4. Finally, Install other add-on cards and their drivers.

## **Installing Windows 98**

1. First, don't install any add-on card except [AGP](#) card.
2. Enable USB Controller in BIOS Setup > Advanced Chipset Features > [USB Controller](#), to make BIOS fully capable of controlling IRQ assignment.
3. Install Window 98 into your system.
4. Install the [VIA 4 in 1 driver](#), which includes VIA AGP Vxd driver, IRQ Routing, VIA ATAPI Vendor Support driver and VIA registry (INF) program.
5. Finally, Install other add-on cards and their drivers.

## **Installing Windows 98 SE, Windows ME & Windows 2000**

If you are using Windows® 98 Second Edition, Windows® Millennium Edition or Windows® 2000, you do not need to install the 4-in-1 driver as the IRQ Routing Driver and the ACPI Registry are already incorporated into the operating system. Users with Windows® 98 SE may update the VIA Registry INF and AGP drivers by installing them individually.

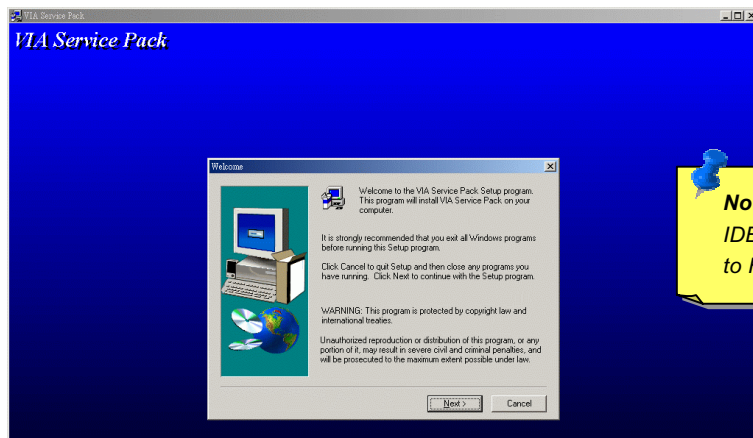

Please refer to [VIA Technologies Inc.](http://www.via.com/) for latest version of 4 in 1 driver:

<http://www.via.com/>

<http://www.via.com/drivers/4in1420.exe>

## Installing VIA 4 in 1 Driver

You can install the VIA 4 in 1 driver ([IDE Bus master](#) (For Windows NT use), VIA ATAPI Vendor Support Driver, VIA [AGP](#), IRQ Routing Driver (For Windows 98 use), VIA Registry (INF) Driver) from the Bonus Pack CD disc Autorun menu.

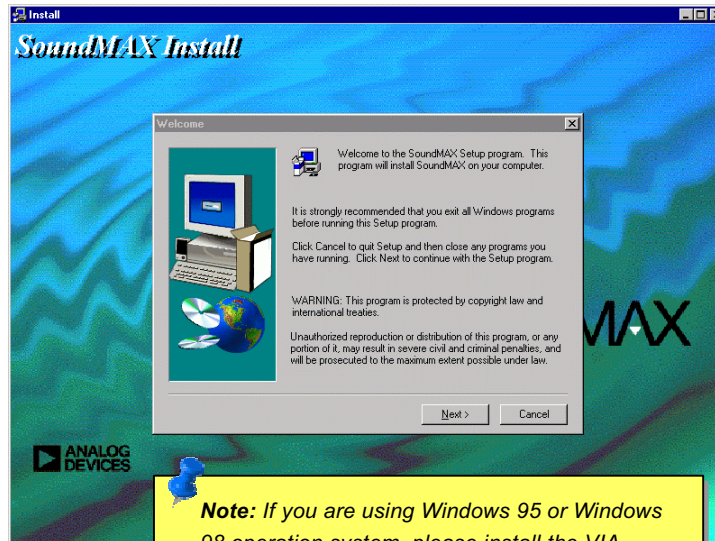

**Note:** Installing this Bus Master IDE driver may cause Suspend to Hard Drive failure.

**Warning:** If you want to uninstall the VIA AGP Vxd driver, please remove the AGP card driver first. Otherwise, the screen may go black at rebooting after the un-installation.

## Installing Onboard Sound Driver

This motherboard comes with an AD 1885 [AC97 CODEC](#) and the sound controller is in VIA South Bridge chipset. You can find the audio driver from the Bonus Pack CD disc Autorun menu.

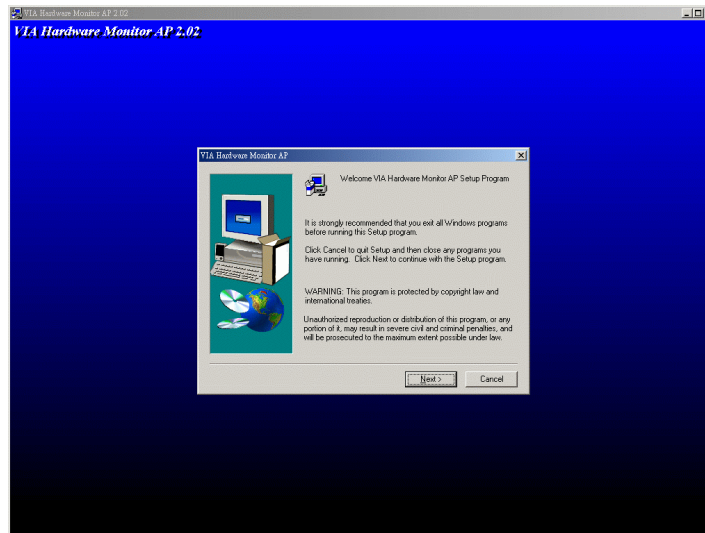

**Note:** If you are using Windows 95 or Windows 98 operation system, please install the VIA audio driver to instead the AD audio driver.

## Installing Hardware Monitoring Utility

You can install Hardware Monitoring Utility to monitor CPU temperature, fans and system voltage. The hardware monitoring function is automatically implemented by the BIOS and utility software. No hardware installation is needed.

## **ACPI Suspend to Hard Drive**

[ACPI](#) Suspend to Hard Drive is basically controlled by Windows operation system. It saves your current work (system status, memory and screen image) into hard disk, and then the system can be totally power off. Next time, when power is on, you can resume your original work directly from hard disk within few seconds without go through the Windows booting process and run your application again. If your memory is 64MB, normally, you need to reserve at least 64MB HDD space to save your memory image.

**When go into Suspend:**

**When power-on next time:**

## System Requirement

1. **AOZVHDD.EXE 1.30b** or later.
2. Delete **config.sys** and **autoexec.bat**.

## Fresh installation of Windows 98 on a new system

1. Execute "**Setup.exe /p j**" to install Windows 98
2. After Windows 98's installation is complete, go to the **Control Panel > Power Management**.
  - a. Set **Power Schemes > System Standby** to "Never".
  - b. Click on "Hibernate" and select "Enable Hibernate Support" then "Apply".
  - c. Click on the "Advanced" tab, you'll see "Hibernate" on "Power Buttons". Note that this option will only be seen after step b mentioned above has been completed, otherwise only "Standby" and "Shutdown" will be shown. Select "Hibernate" and "Apply".
3. Clean boot into DOS and run AOZVHDD utility.
  - a. If you assign the whole disk to your Win 98 system (FAT 16 or FAT 32), please run "**aozvhd /c /file**". Please remember sufficient free space has to be reserved in the disk, e.g. if you have 64 MB DRAM and 16 MB VGA card installed, the system needs at least 80 MB free space. The utility will locate the space automatically.

b. If you assign an individual partition for Win 98, please run "**aozvhd /c /partition**". Of course, the system needs to provide unformatted an empty partition.

4. Reboot system.

5. You've already implemented ACPI Suspend to-Hard Drive. Click "**Start > Shut Down > Standby**" then the screen will go off immediately. And 1 minute or so will be taken for the system to save what's in the memory to the hard drive; the larger the memory size the longer this process will take.

## Changing from APM to ACPI (Windows 98 only)

1. Run "**Regedit.exe**"
  - a. Go through the following path  
HKEY\_LOCAL\_MACHINE  
SOFTWARE  
MICROSOFT  
WINDOWS  
CURRENT VERSION  
DETECT
  - b. Select "ADD Binary" and name it as "**ACPIOPTION**".
  - c. Right click and select Modify, add "01" after "0000" to make it "0000 01".
  - d. Save changes.
2. Select "Add New Hardware" under Control Panel. Allow Windows 98 to detect new hardware. (It will find "**ACPI BIOS**" and remove "**Plug and Play BIOS**")
3. Reboot system.
4. Clean boot into DOS and run "AOZVHDD.EXE /C /File"

## Changing from ACPI to APM

### 1. Run "Regedit.exe"

- a. Go through the following path

HKEY\_LOCAL\_MACHINE

SOFTWARE

MICROSOFT

WINDOWS

CURRENT VERSION

DETECT

ACPI OPTION

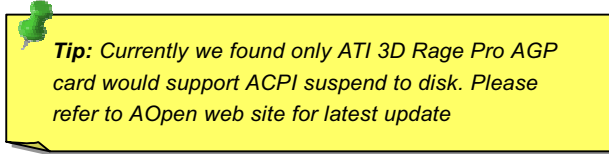

- b. Right click and select "Modify, change "01" to "02" to make it "0000 02".

**Tip:** "02" means Windows 98 is ACPI acknowledged but the ACPI function is disabled.

- c. Save changes.

2. Select "Add New Hardware" under Control Panel. Allow Windows 98 to detect new hardware. (It will find "**Plug and Play BIOS**" and **remove "ACPI BIOS"**)
3. Reboot system.
4. Run "Add New Hardware" again and it will find "Advanced Power Management Resource".
5. Click "OK".

*Tip: Currently we found only ATI 3D Rage Pro AGP card would support ACPI suspend to disk. Please refer to AOpen web site for latest update*

## ACPI Suspend to RAM (STR)

This motherboard supports [ACPI](#) Suspend to RAM function. With this function, you can resume your original work directly from DRAM without going through the Windows 98 booting process and run your application again. Suspend to DRAM saves your current work in the system memory, it is faster than Suspend to Hard Drive but requires power supplied to DRAM, while Suspend to Hard Drive requires no power.

### When go into Suspend:

### When power-on next time:

To implement ACPI Suspend to DRAM, please follow the procedures as below:

### System Requirement

1. An ACPI OS is required. Currently, Windows 98 is the only choice. Please refer to [ACPI Suspend to Hard Drive](#) of how to setup Windows 98 ACPI mode.
2. The VIA 4 in 1 Driver must have been installed properly.

### Procedures

1. Changed the following BIOS settings.

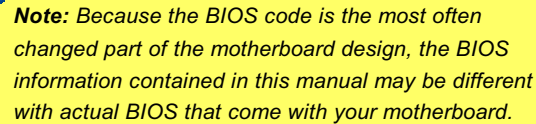

BIOS Setup > Power Management Setup > [ACPI Function](#): Enabled

BIOS Setup > Power Management Setup > [ACPI Suspend Type](#): S3.

2. Go to Control Panel > Power Management. Set "Power Buttons" to "Standby".
3. Press power button or standby button to wake up the system.

## AWARD BIOS

System parameters can be modified by going into [BIOS](#) Setup menu, this menu allows you to configure the system parameters and save the configuration into the 128 bytes CMOS area, (normally in the RTC chip or in the main chipset). [To enter to BIOS setup menu](#), press <Del> when [POST \(Power-On Self Test\)](#) screen is shown on your monitor.

**Note:** *Because the BIOS code is the most often changed part of the motherboard design, the BIOS information contained in this manual may be different with actual BIOS that come with your motherboard.*

## How To Use Award™ BIOS Setup Program

Generally, you can use the arrow keys to highlight items that you want to choose, then press <Enter> key to select, and use the <Page Up> and <Page Down> key to change setting value. You also can press <F1> key for help and press <Esc> key to quit Award™ BIOS setup program. The following table provides details about how to use keyboard in the Award™ BIOS setup program. By the way, all products of AOpen also provides a special function in the BIOS setup, you can press <F3> key selecting preferred menu language to display.

Key	Description
Page Up or +	Changing setting to next value or increase the value.
Page Down or -	Changing setting to previous value or decrease value.
Enter	Select the item.
Esc	1. In main menu: Quit and don't save any change. 2. In sub menu: Exit current menu to main menu.
Up Arrow	Highlight previous item.
Down Arrow	Highlight next item.

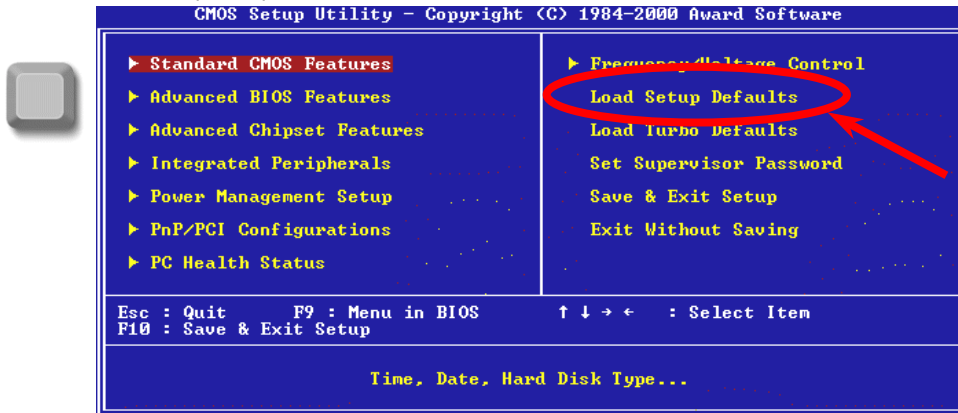

Key	Description
Left Arrow	Move the light bar to left side of menu.
Right Arrow	Move the light bar to right side of menu.
F1	Get menu or item help description.
F3	Changing menu language.
F5	Load previous setting value from CMOS.
F6	Load fail-save setting value from CMOS.
F7	Load turbo setting value from CMOS.
F10	Save changed setting and exit setup program.

**Note:** AOpen always dedicates to give users a more friendly computer system. Now, we include all function descriptions of BIOS setup program into the BIOS Flash ROM. When you select one function of BIOS setup program, the function description will appeared at right side of screen. Hence, you don't need read this manual while you changing the BIOS setting.

## How To Enter BIOS Setup

After you finish the setting of jumpers and connect correct cables. Power on and enter the BIOS Setup, press <Del> during POST (Power-On Self Test). Choose "Load Setup Defaults" for recommended optimal performance.

**Warning:** Please avoid of using "Load Turbo Defaults", unless you are sure your system components (CPU, DRAM, HDD, etc.) are good enough for turbo setting.

## BIOS Upgrade

By flashing your motherboard, you agree to accept the possibility of BIOS flash failure. If your motherboard is working and is stable, and there are no major bugs that were fixed by a latter BIOS revision, we recommend that you DO NOT try to upgrade your BIOS.

By doing so, you are taking a risk of BIOS flash failure. If you indeed intent on upgrading, PLEASE BE SURE to use the right BIOS revision for the right motherboard model.

AOpen Easy Flash is a little different than traditional flash method. The [BIOS](#) binary file and flash routine are linked together and you simply run a single commend to complete the flash process.

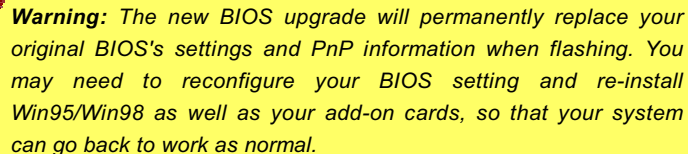

**Caution:** AOpen Easy Flash BIOS programs are designed to be compatible with the Award BIOS. At the date of this note, AOpen Easy Flash BIOS programs are not available for AMI BIOS. AMI BIOS appears mostly only on old 486 boards and some early Pentium boards. Please be sure to view the README compressed inside the BIOS package before upgrading, and follow upgrade instructions carefully. This will minimize the chance of flash failures.

Below are the steps for easy flashing procedures: (applies for Award BIOS ONLY)

1. Download new BIOS upgrade [zip](#) file from AOpen's web site.  
For example, AK73P102.ZIP.
2. Run shareware PKUNZIP (<http://www.pkware.com/>) which supports miscellaneous operation systems to extract the binary BIOS file and the flash utility.  
Or Winzip (<http://www.winzip.com/>) in Windows environment.
3. Save the unzipped file into a bootable floppy disk.  
For example, AK73P102.BIN & AK73P102.EXE
4. Reboot the system to DOS mode without loading any memory handler (such as EMM386) or device driver. It needs around 520K free memory spaces.
5. Execute A:> AK73P102 and the program will do the rest of it.

**DO NOT turn off the power during FLASH PROCESS until you are asked to!!**

6. Reboot system and press <Del> to [enter BIOS setup](#). Choose "[Load Setup Defaults](#)", then "[Save & Exit Setup](#)". Done!

**Warning:** The new BIOS upgrade will permanently replace your original BIOS's settings and PnP information when flashing. You may need to reconfigure your BIOS setting and re-install Win95/Win98 as well as your add-on cards, so that your system can go back to work as normal.

# Overclocking

As a leading manufacturer in motherboard industry, AOpen always listens to what customers want and develop products to fit different user's requirements. Reliability, compatibility, leading technology and friendly features are our basic goals when designing motherboards. Other than above mentioned design criteria, there are power users who are always seeking to push the limitation of the system performance by overclocking which we call them "Overclocker".

This section is dedicated to overclockers.

This high performance motherboard is designed for maximum **100MHz** CPU bus clock. But it comes with clock generator of **166MHz** when we design it to accommodate future CPU bus clock. Our lab test results shown that **166MHz** is achievable when proper setting and qualified components were presented, we feel quite comfortable overclocking to **166MHz**. Not only that, this motherboard has full-range (CPU core voltage) settings and an option to adjust CPU core voltage. The CPU clock ratio can be up to 12.5X that supports almost all of Athlon/Duron CPUs in the future and provides flexibility for overclockers. For your reference, the following configurations are what we feel comfortable at **166MHz** bus clock.

**But not guaranty.** 😊

**Warning:** The design of this product follows CPU and chipset vendor's design guideline. Any attempts to push beyond product specification are not recommended and you are taking your own risk to damage your system or important data. Before doing overclocking, you must make sure your components are able to tolerate such abnormal setting, especially CPU, DRAMs, hard disks, and AGP VGA cards.

**Tip:** Note that overclocking may also cause thermal problem. Please make sure that the cooling fan and the heatsink were adequate to dissipate excessive heat that's generated by overclocking the CPU.

## **VGA Card & Hard Disk**

VGA and HDD is key components for overclocking, for your reference, the following list are what have been successful overclocked in our lab. Please note that AOpen can not guaranty they can be successful overclocked again. Please check the **Available Vendor List (AVL)** by link to our official website.

VGA: <http://www.aopen.com.tw/tech/report/overclk/mb/vga-oc.htm>

HDD: <http://www.aopen.com.tw/tech/report/overclk/mb/hdd-oc.htm>

# Glossary

## AC97

Basically, AC97 specification separates sound/modem circuit to two parts, digital processor and a [CODEC](#) for analogy I/O they are linked by AC97 link bus. Since digital processor can be put into motherboard main chipset, the cost of sound/modem onboard solution can be reduced.

## ACPI (Advanced Configuration & Power Interface)

ACPI is the power management specification of PC97 (1997). It intends to save more power by taking full control of power management to operating system and bypass [BIOS](#). The chipset or super I/O chip needs to provide standard register interface to operating system (such as Windows 98). This is a bit similar as the [PnP](#) register interface. ACPI defines ATX momentary soft power switch to control the power state transition.

### **AGP (Accelerated Graphic Port)**

AGP is a bus interface targeted for high-performance 3D graphic. AGP supports only memory read/write operation and single-master single-slave one-to-one only. AGP uses both rising and falling edge of the 66MHz clock, for 2X AGP, the data transfer rate is  $66\text{MHz} \times 4\text{byte} \times 2 = 528\text{MB/s}$ . AGP is now moving to 4X mode,  $66\text{MHz} \times 4\text{byte} \times 4 = 1056\text{MB/s}$ . AOpen is the first company to support 4X AGP motherboards by both AX6C (Intel 820) and MX64/AX64 (VIA 694x), started from Oct 1999.

### **AMR (Audio/Modem Riser)**

The [CODEC](#) circuit of AC97 sound/modem solution can be put on motherboard or put on a riser card (AMR card) that connects to motherboard through AMR connector.

### **AOpen Bonus Pack CD**

A disc bundled with AOpen motherboard product, there are motherboard drivers, Acrobat Reader for [PDF](#) online manual and other useful utilities.

## **APM**

Unlike [ACPI](#), BIOS controls most APM power management functions. AOpen Suspend to Hard Drive is a good example of APM power management.

## **ATA/66**

ATA/66 uses both rising edge and falling edge but doubles [UDMA/33](#) transfer rate. The data transfer rate is 4 times of the PIO mode 4 or DMA mode 2, 16.6MB/s x 4 = 66MB/s. To use ATA/66, you need special ATA/66 IDE cable.

## **ATA/100**

ATA/100 is a new IDE specification under developing. ATA/100 uses both rising edge and falling edge as [ATA/66](#) but clock cycle time is reduced to 40ns. The data transfer rate is (1/40ns) x 2 bytes x 2 = 100MB/s. To use ATA/100, you need special 80-wire IDE cable, the same as ATA/66.

## **BIOS (Basic Input/Output System)**

BIOS is a set of assembly routine/program that reside in [EPROM](#) or [Flash ROM](#). BIOS controls Input/output devices and other hardware devices of motherboard. In general, to provide hardware independent portability, operation system and drivers is required to access BIOS without directly access hardware devices.

## **Bus Master IDE (DMA mode)**

The traditional PIO (Programmable I/O) IDE requires the CPU to involve in all the activities of the IDE access including waiting for the mechanical events. To reduce the workload of the CPU, the bus master IDE device transfers data from/to memory without interrupting CPU, and releases CPU to operate concurrently while data is transferring between memory and IDE device. You need the bus master IDE driver and the bus master IDE HDD to support bus master IDE mode.

## **CODEC (Coding and Decoding)**

Normally, CODEC means a circuit that can do digital to analog conversion and also the analog to digital conversion. It is part of [AC97](#) sound/modem solution.

### ***DIMM (Dual In Line Memory Module)***

DIMM socket has total 168-pin and supports 64-bit data. It can be single or double side, the golden finger signals on each side of PCB are different, that is why it was called Dual In Line. Almost all DIMMs are made by [SDRAM](#), which operate at 3.3V. Note that some old DIMMs are made by FPM/[EDO](#) and only operate at 5V. Do not confuse them with SDRAM DIMM.

### ***ECC (Error Checking and Correction)***

The ECC mode needs 8 ECC bits for 64-bit data. Each time memory is accessed; ECC bits are updated and checked by a special algorithm. The ECC algorithm has the ability to detect double-bit error and automatically correct single-bit error while parity mode can only detect single-bit error.

### ***EDO (Extended Data Output) Memory***

The EDO DRAM technology is actually very similar to FPM (Fast Page Mode). Unlike traditional FPM that tri-states the memory output data to start the pre-charge activity, EDO DRAM holds the memory data valid until the next memory access cycle, that is similar to pipeline effect and reduces one clock state.

### ***EEPROM (Electronic Erasable Programmable ROM)***

Also known as E<sup>2</sup>PROM. Both EEPROM and [Flash ROM](#) can be re-programmed by electronic signals, but the interface technology is different. Size of EEPROM is much smaller than flash ROM.

### ***EPROM (Erasable Programmable ROM)***

Traditional motherboard stores BIOS code in EPROM. EPROM can only be erased by ultra-violet (UV) light. If BIOS has to be upgraded, you need to remove EPROM from motherboard, clear by UV light, re-program, and then insert back.

### ***EV6 Bus***

EV6 Bus in the technology of Alpha processor from Digital Equipment Corporation. EV6 bus uses both rising and falling clock edge to transfer data, similar as DDR SDRAM or ATA/66 IDE bus.

EV6 Bus Speed = CPU external bus clock x 2.

For example, 200 MHz EV6 bus is actually using 100 MHz external bus clock, but the equivalent speed is 200 MHz.

### **FCC DoC (Declaration of Conformity)**

The DoC is component certification standard of FCC EMI regulations. This standard allows DIY component (such as motherboard) to apply DoC label separately without a shielding of housing.

### **FC-PGA**

FC means Flip Chip, FC-PGA is a new package of Intel for Pentium III CPU. It can plug into SKT370 socket, but require motherboard to add some signals on socket 370. That is, the motherboard needs to be redesigned. Intel is going to ship FC-PGA 370 CPU and phase out slot1 CPU.

### **Flash ROM**

Flash ROM can be re-programmed by electronic signals. It is easier for BIOS to upgrade by a flash utility, but it is also easier to be infected by virus. Because of increase of new functions, BIOS size is increased from 64KB to 256KB (2M bit). AOpen AX5T is the first board to implement 256KB (2Mbit) Flash ROM. Now flash ROM size is moving to 4M bit on AX6C (Intel 820) and MX3W (Intel 810) motherboard. , AOpen motherboard uses EEPROM for jumper-less and battery-less design.

## **FSB (Front Side Bus) Clock**

FSB Clock means CPU external bus clock.

CPU internal clock = CPU FSB Clock x CPU Clock Ratio

## **I<sup>2</sup>C Bus**

See [SMBus](#).

## **P1394**

P1394 (IEEE 1394) is a standard of high-speed serial peripheral bus. Unlike low or medium speed [USB](#), P1394 supports 50 to 1000Mbit/s and can be used for video camera, disk and LAN.

## **Parity Bit**

The parity mode uses 1 parity bit for each byte, normally it is even parity mode, that is, each time the memory data is updated, parity bit will be adjusted to have even count "1" for each byte. When next time, if memory is read with odd number of "1", the parity error is occurred and this is called single bit error detection.

### **PBSRAM (Pipelined Burst SRAM)**

For Socket 7 CPU, one burst data read requires four QWord (Quad-word, 4x16 = 64 bits). PBSRAM only needs one address decoding time and automatically sends the remaining QWords to CPU according to a predefined sequence. Normally, it is 3-1-1-1, total 6 clocks, which is faster than asynchronous SRAM. PBSRAM is often used on L2 (level 2) cache of Socket 7 CPU. Slot 1 and Socket 370 CPU do not need PBSRAM.

### **PC100 DIMM**

[SDRAM](#) DIMM that supports 100MHz CPU [FSB](#) bus clock.

### **PC133 DIMM**

[SDRAM](#) DIMM that supports 133MHz CPU [FSB](#) bus clock.

### **PDF Format**

A file format for electronic document, PDF format is independent from platform, you can read PDF file under Windows, Unix, Linux, Mac ... with different PDF reader. You can also read PDF file by web browser such as IE and Netscape, note that you need to install PDF plug-in first (Included in Acrobat Reader).

### ***PnP (Plug and Play)***

The PnP specification suggests a standard register interface for both BIOS and operating system (such as Windows 95). These registers are used by BIOS and operating system to configure system resource and prevent any conflicts. PnP BIOS or operating system will automatically allocate the IRQ/DMA/Memory. Currently, almost all the PCI cards and most ISA cards are already PnP compliant.

### ***POST (Power-On Self Test)***

The BIOS self-test procedure after power-on, sometimes, it is the first or the second screen shown on your monitor during system boot.

### ***RDRAM (Rambus DRAM)***

Rambus is a memory technology that uses large burst mode data transfer. Theoretically, the data transfer should be high than [SDRAM](#). RDRAM is cascaded in channel operation. For Intel 820, only one RDRAM channel is supported, 16-bit data per channel, and this channel may have maximum 32 RDRAM devices, no matter how many [RIMM](#) sockets.

## **RIMM**

184-pin memory module that supports [RDRAM](#) memory technology. A RIMM memory module may contain up to maximum of 16 RDRAM devices.

## **SDRAM (Synchronous DRAM)**

SDRAM is one of the DRAM technologies that allows DRAM to use the same clock as the CPU host bus ([EDO](#) and FPM are asynchronous and do not have clock signal). It is similar as [PBSRAM](#) to use burst mode transfer. SDRAM comes in 64-bit 168-pin [DIMM](#) and operates at 3.3V. AOpen is the first company to support dual-SDRAM DIMMs onboard (AP5V), from Q1 1996

## **Shadow E<sup>2</sup>PROM**

A memory space in Flash-ROM to simulate E<sup>2</sup>PROM operation, AOpen motherboard uses Shadow E<sup>2</sup>PROM for jumper-less and battery-less design

### ***SIMM (Single In Line Memory Module)***

SIMM socket is only 72-pin, and is only single side. The golden finger signals on each side of PCB are identical. That is why it was called Single In Line. SIMM is made by FPM or [EDO](#) DRAM and supports 32-bit data. SIMM had been phased out on current motherboard design.

### ***SMBus (System Management Bus)***

SMBus is also called I2C bus. It is a two-wire bus developed for component communication (especially for semiconductor IC). For example, set clock of clock generator for jumper-less motherboard. The data transfer rate of SMBus is only 100Kbit/s, it allows one host to communicate with CPU and many masters and slaves to send/receive message.

### ***SPD (Serial Presence Detect)***

SPD is a small ROM or [EEPROM](#) device resided on the [DIMM](#) or [RIMM](#). SPD stores memory module information such as DRAM timing and chip parameters. SPD can be used by [BIOS](#) to decide best timing for this DIMM or RIMM.

### **Ultra DMA/33**

Unlike traditional PIO/DMA mode, which only uses the rising edge of IDE command signal to transfer data. UDMA/33 uses both rising edge and falling edge, the data transfer rate is double of the PIO mode 4 or DMA mode 2.

16.6MB/s x2 = 33MB/s

### **USB (Universal Serial Bus)**

USB is a 4-pin serial peripheral bus that is capable of cascading low/medium speed peripherals (less than 10Mbit/s) such as keyboard, mouse, joystick, scanner, printer and modem. With USB, the traditional complex cables from back panel of your PC can be eliminated.

### **VCM (Virtual Channel Memory)**

NEC's Virtual Channel Memory (VCM) is a new DRAM core architecture that dramatically improves the memory system's ability to service multimedia requirements. VCM increases memory bus efficiency and performance of any DRAM technology by providing a set of fast static registers between the memory core and I/O pins. Using VCM technology results in reduced data access latency and reduced power consumption.

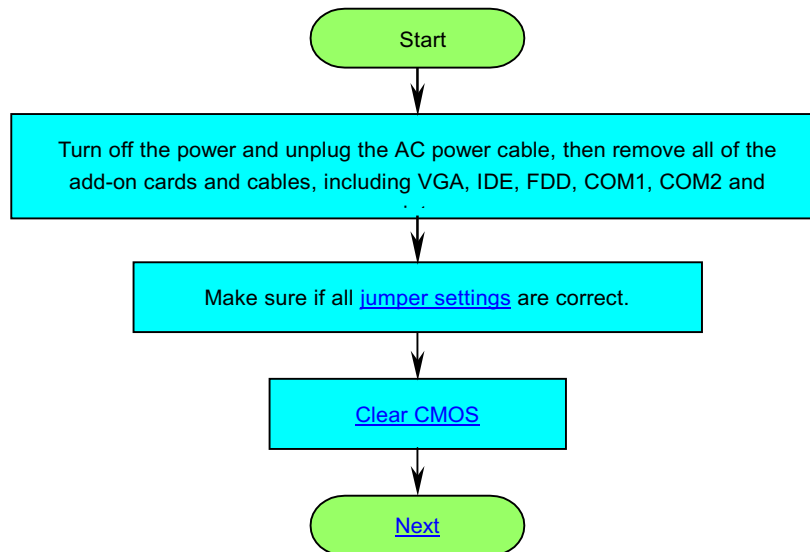

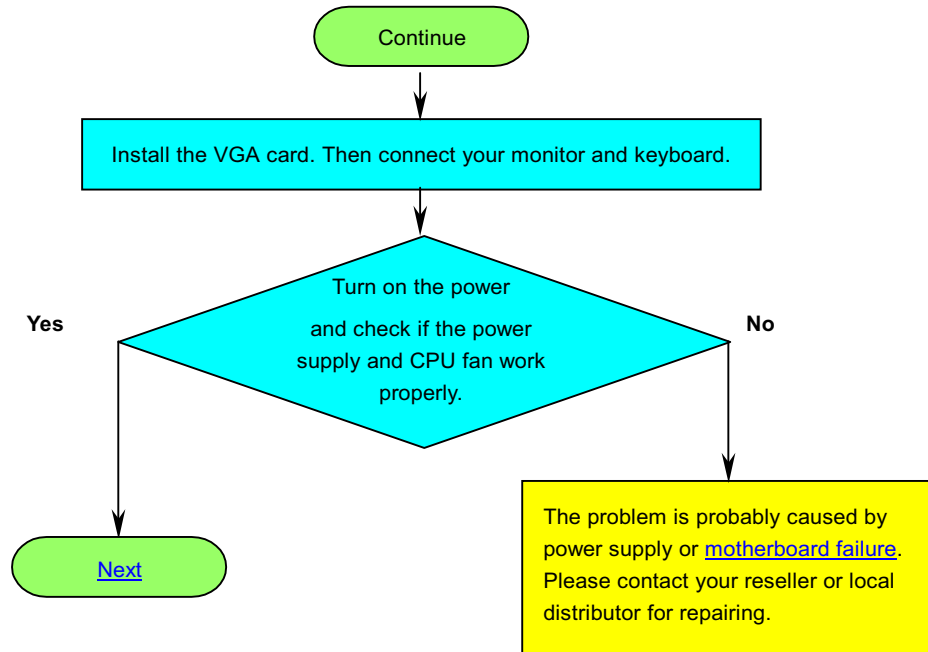

**ZIP file**

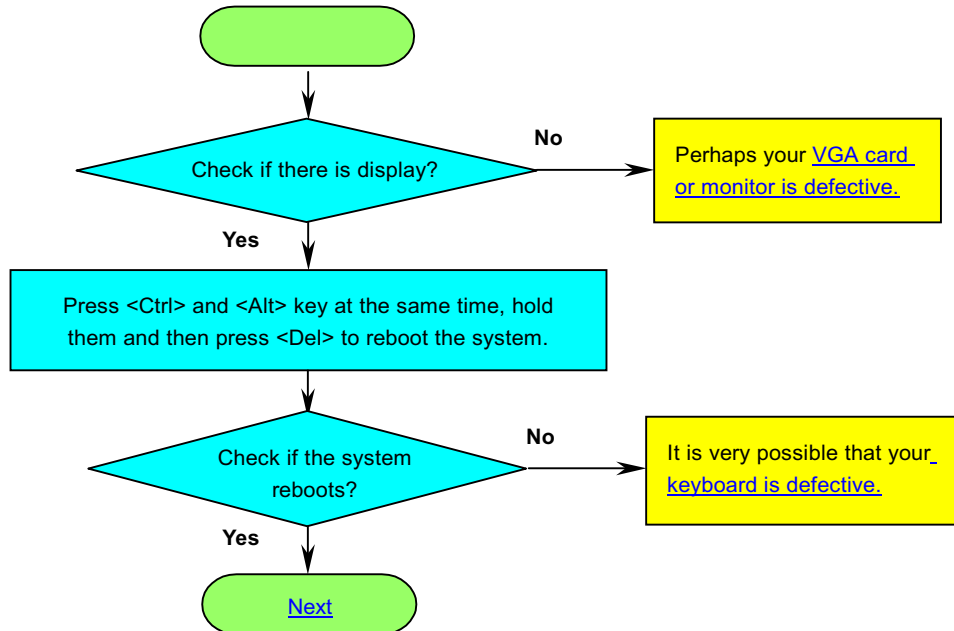

A compressed file format to reduce file size. To unzip file, run shareware PKUNZIP (<http://www.pkware.com/>) for DOS and other operating system or WINZIP (<http://www.winzip.com/>) for windows environment.

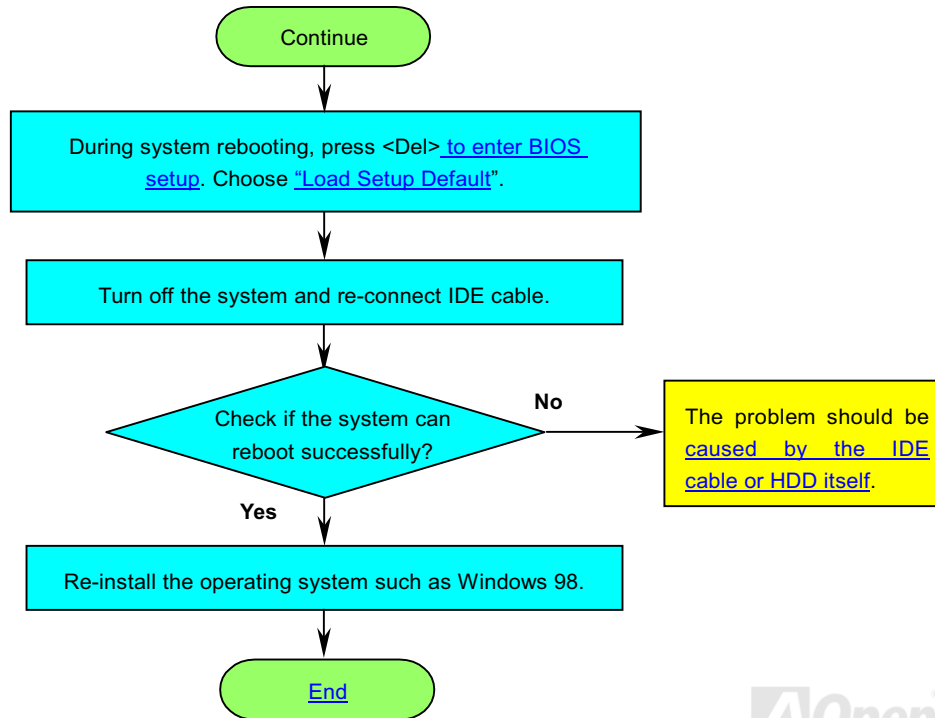

# Troubleshooting

## Technical Support

Dear Customer,

Thanks for choosing AOpen products. To provide the best and fastest service to our customer is our first priority. However, we receive numerous emails and phone-calls worldwide everyday, it is very hard for us to serve everyone on time. We recommend you follow the procedures below and seek help before contact us. With your help, we can then continue to provide the best quality service to more customers.

Thanks very much for your understanding!

AOpen Technical Supporting Team

**1**

**Online Manual:** Please check the manual carefully and make sure the jumper settings and installation procedure are correct.

<http://www.aopen.com.tw/tech/download/manual/default.htm>

**2**

**Test Report:** We recommend to choose board/card/device from the compatibility test reports for assembling your PC.

<http://www.aopen.com.tw/tech/report/default.htm>

**3**

**FAQ:** The latest FAQ (Frequently Asked Questions) may contain a solution to your problem.

<http://www.aopen.com.tw/tech/faq/default.htm>

**4**

**Download Software:** Check out this table to get the latest updated BIOS/utility and drivers.

<http://www.aopen.com.tw/tech/download/default.htm>

**5**

**News Group:** Your problem probably had been answered by our support engineer or professional users on the news group.

<http://www.aopen.com.tw/tech/newsgrp/default.htm>

**6**

**Contact Distributors/Resellers:** We sell our products through resellers and integrators. They should know your system configuration very well and should be able to solve your problem more efficiently than us. After all, their attitude of service is an important reference for you if next time you want to buy something else from them.

**7**

**Contact Us:** Please prepare detail system configuration and error symptom before contacting us. The **part number**, **serial number** and **BIOS version** are also very helpful.

### Part Number and Serial Number

The Part Number and Serial number are printed on bar code label. You can find this bar code label on the outside packing, on ISA/CPU slot or on component side of PCB. For example:

Part No.

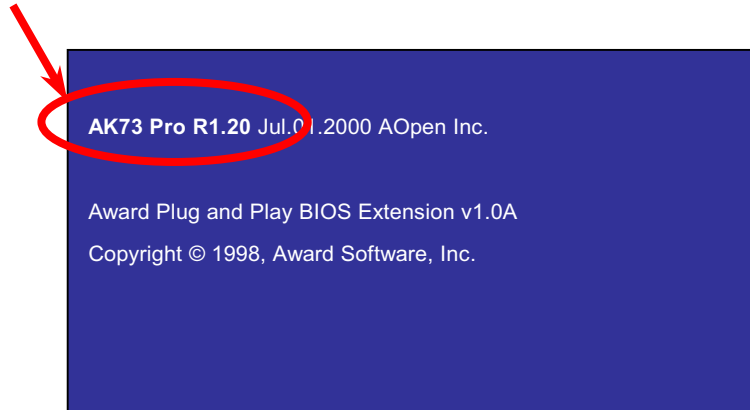

Serial No.

**P/N: 91.88110.201** is part number, **S/N: 91949378KN73** is serial number.

**Model name and BIOS version**

Model name and BIOS version can be found on upper left corner of first boot screen ([POST](#) screen). For example:

**AK73 Pro/AK73 Pro(A)** is model name of motherboard, **R1.20** is BIOS version.

# Product Registration

ClubAOpen Welcome to AOpen Inc.

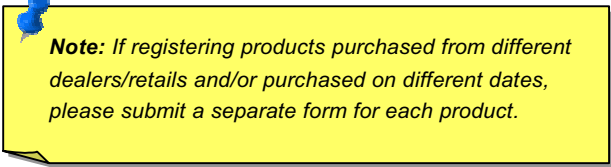

Thank you for choosing AOpen product. AOpen encourages you to spend few minutes in completing the following product registration. To register your product will ensure the high quality of services from AOpen. After the registration, you will:

- Have opportunities to play online slot machine and win a prize from AOpen by accumulating your bonuses for later prize exchange.
- Be upgraded to gold membership of Club AOpen program.
- Receive email notification about product safety alerts. Its purpose is to alert consumers quickly and conveniently when products contain technical issues.
- Receive email notification about latest product's announcements.
- Be able to personalize your AOpen web pages.
- Receive e-mail notification about latest BIOS/Driver/Software release information.
- Have opportunities to participate special product promotional programs.
- Enjoy higher service priority to receive technical assistance provided by AOpen specialists worldwide.

- Be able to join the discussions of web-based news groups.

AOpen makes sure that the information you provide is encrypted, so that it cannot be read or intercepted by other people or companies. Further, AOpen will not disclose any of information you submitted under any conditions. Please consult our [online privacy policy](#) for further information on our company policy.

**Note:** *If registering products purchased from different dealers/retails and/or purchased on different dates, please submit a separate form for each product.*
